HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
PORT CALL EXTRACTION AND CHARACTERISATION FROM MARITIME NAVIGATIONAL DATA: AN APPLICATION TO THE LESSER ANTILLES

CONTEXT

- Our work focuses on maritime transport characterisation and its impact in the Caribbean, a region fragmented into multiple territories and different sovereignties owing to major administrative and regulatory discrepancies.
- We aim at assessing port vulnerability through port traffic data extracted from vessel positions, and analysed through the prism of the port call.

DATA

This analysis is based on the joint use of AIS data and a mapping of the ports of the study area.
- The AIS dataset has been acquired from the company exactEarth for the Caribbean and the Gulf of Mexico for the full year 2019 (TRAFC project, funded by the Fondation de France). This dataset contains about 642M messages, i.e. 1.76M per day.
- The port mapping has been interpreted using satellite imagery (Google Earth, Bing) with QGIS. The commercial berths (quays and wharves) of 387 ports have been meticulously surveyed at the 1/5000 scale. In the Lesser Antilles, a total of 101 ports and 296 port structures has been identified.

PORT CALL ANALYSIS

Extraction

Arrivals and departures (day and hour) are timestamped at the crossing of a speed threshold of 0.5 knots in the vicinity of a port infrastructure.

Characterisation

Spatial and temporal characteristics of the port call are computed from AIS data. They are completed by vessel characteristics extracted from a database maintained by the IHS Markit firm.

Generation of a database of port calls

- 1 455 000 port calls in the whole of the Caribbean area in 2019
- 171 000 port calls in the 101 surveyed ports of the Lesser Antilles

Vessel Dataset

Enrichment

The vessel database is enhanced through a method of enrichment which aims at retrieving vessels that are not described in IHS Markit’s data by using the clusters of precise vessel stopping location, and considering that similar vessels tend to stop at the same berth.

RESULTS

- Values are given for each port, for each vessel type and along various parameters: age or vessel tonnage, port call duration or total number of calls.
- They are validated in comparison with a UNCTAD database (article in progress)

Number of port calls for container vessels (left) and mean tonnage of bulk vessels (right)

UPCOMING WORK...

- Determination of inter-ports journeys, and of vessel trajectories in the Caribbean
- Characterisation of networks and subnetworks between ports, according to vessel types and port calls characteristics
- Development of a geovisualisation dashboard of port calls and related indicators, enabling the assessment of port activity, traffic pressure applied on ports and port vulnerabilities.
